ROTOR HUB

5.3 ROTOR HUB

5.3.1 INTRODUCTION

THE ROTOR HUB CONSISTS OF THE HUB STRUCTURE, THE UPPER (ROTATING) AND LOWER (STATIONARY) DUCTS, MAIN ROTOR SHAFT, TRUNNION, GIMBAL FITTINGS, SPOKE AND THE UPPER AND LOWER MAIN ROTOR SHAFT BEARINGS.

THIS SECTION IS DIVIDED INTO 3 SUB-SECTIONS COVERING HUB STRUCTURE ANALYSIS, HUB DUCTS ANALYSIS AND MAIN ROTOR SHAFT ANALYSIS, EACH WITH THEIR RELATED COMPONENTS.

ANALYSIS HOT CYCLE ROTOR
PREPARED BY L.L. ERLE 20 FEB 62
CHECKED BY _____MODEL 285REPORT NO. 285-135.3.2
PAGE —HUB ANALYSIS5.3.2 HUB ANALYSIS (HUB STRUCTURE)

THE HUB STRUCTURE PROVIDES THE ROOT MOUNTING STRUCTURE FOR THE ROTOR BLADES, THE INBOARD MOUNTING FOR THE BLADE STRAPS AND ARTICULATING DUCTS AS WELL AS THE FEATHERING BEARING HOUSING.

LOADS, WITH THE EXCEPTION OF THE GROUND FLAPPING CONDITION, ARE APPLIED TO THE HUB FROM EACH BLADE AND BALANCED OUT THRU THE HUB STRUCTURE.

FOR SIMPLIFICATION THE ANALYSIS IS DIVIDED INTO UPPER AND LOWER HUB SECTIONS.

ULTIMATE AND WEIGHTED FATIGUE ANALYSES ARE INVESTIGATED AND, WHERE APPLICABLE, THE GROUND FLAPPING CONDITION.

POINT A REPRESENTS THE INTERSECTION OF THE STIFFENER AND CENTER RING SUPPORTS.

DUCT INTERNAL PRESSURE FORCES - INTERNAL PICTURE

THE INTERNAL PRESSURES OF THE DUCT WILL TEND TO STRAIGHTEN OUT THE DUCT CAUSING BENDING IN THE DUCT. THE STRUCTURE BELOW CENTER RING SUPPORT IS A WELL SUPPORTED, FAIRLY STIFF STRUCTURE AND IT IS REASONABLE TO CONSIDER THAT ANY MOMENT TENDING TO STRAIGHTEN OUT THE DUCT WILL BE RESISTED AS A COUPLE BETWEEN POINTS A & B. TO DETERMINE THIS BENDING MOMENT IT IS FIRST NECESSARY TO FIND THE INTERNAL LOADING OF THE DUCT.

TO FACILITATE THE ANALYSIS, SEVERAL SIMPLIFYING GENERALIZATIONS ARE MADE TO THE GEOMETRY OF THE DUCT.

1. CONSIDER THE DUCT AS A QUARTER SECTION OF A TORUS.
2. A MEAN SECTION, ELLIPTICAL IN SHAPE IS ASSUMED.

$$W = 282 \#/\text{IN LIMIT}$$

$$D = R \sin \alpha$$

$$ds = R d\alpha$$

$$M = (W \cos \alpha)(D) = (W \cos \alpha)(R \sin \alpha)$$

$$dM = (W \cos \alpha)(R \sin \alpha)(R d\alpha)$$

$$M = \int_0^{32.5^\circ} W \cos \alpha R^2 \sin \alpha d\alpha$$

$$= WR^2 \int_0^{32.5^\circ} \cos \alpha \sin \alpha d\alpha$$

$$= WR^2 \left[\frac{1}{2} \sin^2 \alpha \right]_0^{32.5^\circ} = .1443 WR^2$$

$$M_A = (.1443)(282)(7.2^2) = 2110 \# \text{ LIMIT}$$

LOADS IN STIFFENER SUPPORTS -

DUE TO THEIR CROSS-SECTIONAL SHAPE, THE INTERNAL PRESSURE ACTING ON THE DUCT "CORNERS" (I.E. THE INTERSECTION OF THE CURVED WALLS) WILL TEND TO SEPARATE THE WALL SEGMENTS AND IN SO DOING IMPOSE A LOADING ON THE DUCT STIFFENER SUPPORTS. THE "RADIAL" COMPONENTS OF THESE FORCES ARE NORMAL TO THE DUCT CENTER-PLANE AND AS SUCH ARE ALSO NORMAL TO THE FACE OF THE STIFFENER SUPPORTS ON EITHER SIDE OF THE DUCTS. THERE ARE ALSO, IN SOME CASES, "TANGENTIAL" FORCES, COPLANAR WITH, AND PERPENDICULAR TO THE "RADIAL" FORCES, BUT THESE ARE RELATIVELY SMALL AND ARE NEGLECTED IN THE ANALYSIS.

 PAGE _____

HUB DUCTS

DUCT ASSY - LOWER, STATIONARY (285-0512) (CONT'D)

INTERNAL ANALYSIS OF FORCES

THE INTERNAL PRESSURE ACTING ON THE DUCT WALLS WILL TEND TO STRAIGHTEN OUT THE DUCT AND THEREBY CAUSE BENDING IN THE DUCT. FROM THE GEOMETRY OF THE DUCT STRUCTURE IT CAN BE SEEN THAT WHAT AMOUNTS TO THE UPPER HALF OF THE DUCT IS SUPPORTED BETWEEN THE UPPER KING SUPPORT AND THE SUPPORT BRACES, THE LOWER HALF BEING ONLY PARTIALLY SUPPORTED. ON THIS BASIS, THE LOWER HALF WILL BE CONSIDERED AS UNSUPPORTED STRUCTURE.

AVERAGE CROSS-SECTION

$$R_1 = 9.5 \text{ IN}$$

$$R_2 = 9.5 + 8.2 = 17.7 \text{ IN}$$

TO FACILITATE ANALYSIS, THE FOLLOWING GENERALIZATIONS ARE MADE TO THE GEOMETRY OF THE DUCT:

1. CONSIDER THE DUCT AS A SECTION OF A TORUS
2. ASSUME A CONSTANT ELLIPTICAL CROSS-SECTION

UNIT LOADING -

USING A UNIT 1 INCH WIDE STRIP -

$$W_{\text{STRIP}} = (13.4)(26.9) = 360 \# \text{ LIMIT}$$

FOR THE FIGURE AT LEFT ABOVE:

$$ds = R d\theta$$

$$P_R = 2 \int_0^{29^\circ} W \cos \theta = 2 \int_0^{29^\circ} R d\theta W \cos \theta = 2WR \int_0^{29^\circ} \cos \theta d\theta = 2WR [\sin \theta]_0^{29^\circ}$$

$$\text{AND: } P_R = (2)(360)(8.2)[.4848] = 2860 \# \text{ LIMIT}$$

THIS COMPARES FAVORABLY TO $P_R = 2770 \# \text{ LIMIT}$ AS CALCULATED IN THE EXTERNAL ANALYSIS.

HUB DUCTS

DUCT ASSY- LOWER, STATIONARY (285-0522) (CONT'D)

BENDING OF DUCT DUE TO INTERNAL PRESSURE-

$$R_1 = 9.5 \text{ IN}$$

$$R_2 = 17.7 \text{ IN}$$

$$W = 360 \text{ \#/IN LIMIT}$$

$$D = R \sin \alpha$$

$$ds = R d\alpha$$

$$M = (W \cos \alpha)(D) = (W \cos \alpha)(R \sin \alpha)$$

$$dM = (W \cos \alpha)(R \sin \alpha)(R d\alpha)$$

$$M = WR^2 \int_0^{\alpha} \cos \alpha \sin \alpha d\alpha = WR^2 \left[\frac{1}{2} \sin^2 \alpha \right]_0^{14.5^\circ} = .0314 WR^2$$

$$M = .0314(360)(8.2)^2 = 760 \text{ \"\# LIMIT}$$

LOADS IN STIFFENER SUPPORTS

DUE TO THE CROSS-SECTIONAL SHAPE OF THE DUCT, THE INTERNAL PRESSURE ACTING ON THE DUCT WALLS WILL TEND TO PRY THEM APART AT THE DUCT "CORNERS" (I.E. THE INTERSECTION OF THE DUCT WALLS) AND IN SO DOING IMPOSE A LOADING ON THE STIFFENER SUPPORTS. THE "RADIAL" COMPONENTS OF THESE FORCES ARE PERPENDICULAR TO THE CENTER PLANE OF THE DUCT. THERE ARE ALSO "TANGENTIAL" FORCES, COPLANAR WITH, AND PERPENDICULAR TO THE "RADIAL" FORCES.

DUCT ASSY - LOWER, STATIONARY (285-0522) (CONT'D)

PLOTS OF ANGULAR POSITION VS LOAD SHOW THAT P_V AND P_H DISTRIBUTIONS ARE BASICALLY TRIANGULAR.

FOR PURPOSES OF THIS ANALYSIS THE LOADINGS USED WILL BE THE TRIANGULAR APPROXIMATIONS SHOWN, 32° TO 90°:

TORSION IN STIFFENER SUPPORTS -

DUE TO THE CURVATURE OF THE BEAM IN THE PLANE PARALLEL TO THE DUCT CENTER PLANE A TORSIONAL MOMENT IS INDUCED IN THE STIFFENER FROM THE LOADINGS P_H . THE SIDE LOADING, P_V , ALSO INDUCES A TORSIONAL MOMENT IN THE SAME DIRECTION DUE TO THE OFFSET OF THE STIFFENER AXIS AND THE POINTS OF APPLICATION OF THE LOADING

FOR THE P_H DISTRIBUTION -

ASSUME THE TOTAL LOAD ACTING AT THE C.G. OF THE LOADING:

$$T_{e_1} = (95)(4.9)(14.6) = 1750 \text{ " # LIMIT}$$

FOR THE P_V DISTRIBUTION -

ASSUME THE TOTAL LOAD ACTING AT ONE POINT ON THE BASE OF THE STIFFENER

$$T_{e_2} = (40)(.8)(14.6) = 467 \text{ " # LIMIT}$$

TORSION WILL BE RESISTED BY THE SUPPORT BEACES LOCATED APPROX. AT THE CENTER OF THE BEAM.

MAIN ROTOR SHAFT

285-0528 GIMBAL RING (CONT'D)

SINCE THE RING WILL NOT RESIST TORSION IN ANY "PANEL" THE APPLIED TORSIONAL MOMENTS WILL BE RESISTED AS BENDING IN THE SECTIONS AT RIGHT ANGLES TO THE SECTIONS OF APPLICATION.

$$M_E = M_P = T_R = T_P = .707 \times P_r \times 1.80 = 1.27 P_r$$

TREATING THE PART AS TWO SEPARATE "UPPER" AND "LOWER" RINGS THE MOMENTS ARE RESOLVED INTO COUPLES AS SHOWN. THE "UPPER" RING THEN HAS THE LOADS SHOWN LEFT BELOW

THE LOADS ARE THEN RESOLVED INTO THE COMPONENTS AS SHOWN AT RIGHT ABOVE. THESE FORCES ARE NOW TRANSFERRED TO ASSUMED POINTS OF INFLECTION TAKEN AT THE CENTER OF THE OBLIQUE SECTIONS

$$P = JK + MN = 1212 \pm 2563 + 1400 \pm 2970$$

$$= 2612 \pm 5533 \text{ LBS}$$

$$P_1 = 8145 \#, P_2 = P_3 = -154 \#$$

$$\text{THRUST} = 8145 - 2 \times 154 = 7837 \#$$

$$\text{MOMENT} = 8145 \times 4.7 + 154 \times 2 \times 4.7 \sin 30^\circ$$

$$= 38920 \text{ IN} \cdot \#$$

$$\text{MAX. LOAD/BOLT} = \frac{7837}{24} + \frac{38920}{55} \times \frac{\pi \times 8.38}{24}$$

$$= 2203 \#$$

$$\text{MIN. LOAD/BOLT} = 0$$

THESE BOLTS HAVE AN ULTIMATE STRENGTH OF 8700 # TENSION AND WILL BE TORQUED TO 200-225 IN # TO GIVE THEM A PRELOAD > 4000 # WHICH WILL VIRTUALLY ELIMINATE FATIGUE.
